What you will find in Best Practice Guide for Digital Learners?

Project 2020-1-UK01-KA226-VET-094700
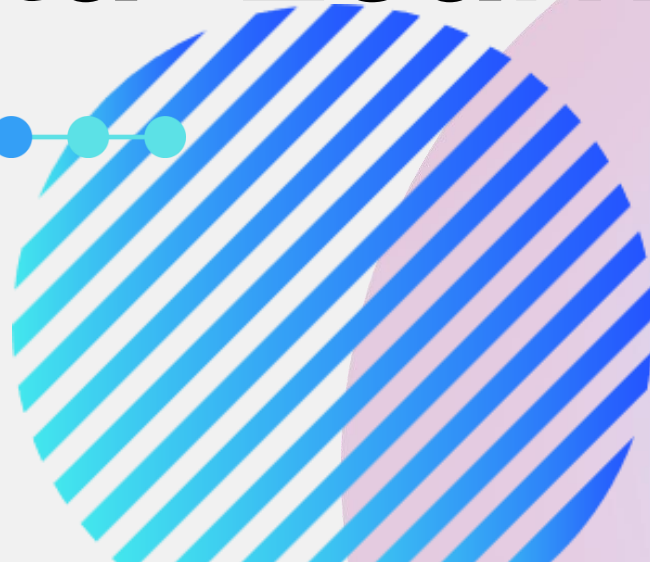

Introduction/ Foreword

- Through the scrutiny of a learner's perspective and tutors' private insights into online education, which was a consequence of COVID-19 disease, we explore the areas which require more intervention, adjustment and improvement.

How to learn successfully and effectively online?

- The customization of courses, using relevant e-tools, technical requirements, proper time management, effective collaboration with a tutor and rewarding system play a crucial role in goal achievement.

Online education from a learner's perspective

- The chapter presents various aspects of digital education from young learners' points of view.

Best practices in online education

- Best practices in online education take into account i.a.: consolidation of material, students' involvement in the activities proposed, knowledge verification or widely-understood evaluation, will surely enrich the Best Practice Guide for Digital Learners.

How to learn successfully and effectively online?

Crucial aspects of effective online education:

- Goals and expectations of learners
- How to respond to learners' needs and create tailor-made courses?
- Challenges of online education and a variety of e-tools needed
- Technical requirements to meet and digital skills to gain for the purposes of e-classes
- Other important skills and tips i.a. for study space and time management
- How to stay connected, collaborate and interact with peers in virtual classrooms?

Conducting successful and effective classes in a virtual environment requires huge efforts and involvement of teachers and learners. Only a combination of many determinants may lead to the final success of the learning process.

Online education from a learner's perspective

Selected aspects covered in a survey questionnaire addressed to digital learners:

- Digital skills (incl. limitations)
- Technical problems during online sessions
- Knowledge of relevant e-tools (incl. platforms)
- Resources used by digital tutors and their effectiveness
- Learners' motivation to participate in e-classes
- Differences between traditional learning process and online sessions

*The survey questionnaire was carried out among over **50 digital learners** from **6 European countries.***

Best practices in online education

The areas the best practices relate to:

- Introduction of new learning material
- Consolidation of material/ self-study or independent work
- Students' involvement activities/ interaction in pairs or groups
- Knowledge verification/ exams and tests
- Ways of evaluation

Given the spontaneous and immediate demand for learners traditionally learning in a classroom to move to an online environment, many of them were thrown into the deep end. However, good practices prove that in every aspect of education, remote learning process can be effective and fun, even though this transition triggered a different skill set.
